<u>My Prompt:</u>

Act as Complete Software Automation and Manual Tester, with expertise in Automation, Manual and API testing

Mandatory - ELI15 - API testing
CRITICAL - On my confirmation proceed to next action
Strict - Next ELI5 - API testing
MANDATORY -TL;DR - API testing
CRitical - Generate Automation Framework for API testing on Acqueon Campaign Manager
MANdatory - Ask me 5 important multi choice questions to build this Framework
STRICT - Proceed to next question after previous question is answered
Strict - Based on my confirmation , proceed to next task
MANDATORY - Generate Test Strategy Document for Testing Acqueon Campaign Manage
MANdatory - Ask me 5 important multi choice questions to build document one by one
STRICT - Proceed to next question after previous question is answered
Mandatory - Give this in MS word document with proper format and Layour and Header , one by one in the order response is generated
STRICT : The response must be in Professional tone.

Where My Prompt failed:

I prompted to ask 5 questions for building Generate Test Strategy Document for Testing Acqueon Campaign Manage – did not happen.

I thought whole response would be generated in one single MS word document- did not happen.

Copilot said:

Copilot

Understood. I will **strictly follow the order**, pause at the required checkpoints, and **proceed only on your confirmationfre**.

I am now acting as a **Complete Software Automation & Manual Tester** with strong expertise in **Automation, Manual, and API Testing**, and I will maintain a **professional tone** throughout.

✅ STEP 1 — ELI-15: API Testing

(MANDATORY – Delivered now)
(CRITICAL – I will STOP after this until your confirmation)

ELI-15: What is API Testing?

🧠 What is an API?

An **API (Application Programming Interface)** is a way for two software systems to **talk to each other**.

When you use a website or app:

- The screen takes your input
- An API sends that input to the backend system
- The backend processes it and sends a response back through the API

You don't see the API, but **all important actions depend on it**.

✅ What is API Testing?

API testing means verifying that this communication works correctly, without using the user interface.

In API testing, we check:

- Whether the backend **accepts valid requests**
- Whether it **rejects invalid or unauthorized requests**
- Whether it applies **business rules correctly**
- Whether it sends **accurate, secure, and consistent responses**

🔐 Example: Login

When you log in:

1. You enter UserID and Password
2. A login API sends these details to the backend
3. The backend checks:
    - Does the user exist?
    - Is the password correct?
    - Is the account active?
4. The API responds with success or failure

✅ **API testing validates this logic directly**, without clicking buttons.

□ What Do We Validate in API Testing?

From a professional perspective, API testing validates:

- **Status codes** (success or failure)
- **Business rules** (who is allowed, who is blocked)
- **Data correctness** (response content)
- **Security behavior** (no sensitive data leakage)
- **Error handling** (clear but safe error messages)

⚖️ Why API Testing is Important

API testing:

- Detects bugs earlier than UI testing
- Is faster and more stable than UI automation
- Protects core business logic
- Is essential for microservices and integrations

Modern systems **cannot survive without strong API testing**.

✅ One-Line ELI-15 Summary

API testing ensures the system's core logic works correctly, securely, and consistently, independent of the user interface.

⏸ STOPPING HERE AS REQUIRED

✅ Please confirm to proceed to the NEXT ACTION:

Reply with **"CONFIRM"** to proceed to:

➡ STEP 2: ELI-5 – API Testing *(Strict next step)*

I will not move forward until your confirmation.

CONFIRM

Copilot said:

Copilot

✅ **Confirmation received. Proceeding as instructed.**

I will now deliver **STEP 2** only.
I will **stop after this step** and wait for your confirmation before moving forward.

✅ STEP 2 — ELI-5: API Testing

(MANDATORY – Delivered now)
(STRICT – Simple, clean, non-technical)

ELI-5: What is API Testing?

Imagine this first…

You ask someone:

"Can I have a toy?"

- **You** are asking
- **Someone else** decides yes or no
- The **message between you** is the API

An **API** is just how computers **talk to each other**.

✅ What is an API?

An API is like a **messenger**.

- You ask something
- The messenger takes your question
- The computer thinks
- The messenger brings the answer back

✅ What is API Testing?

API testing means checking if the messenger is doing its job properly.

We check:

- Did the message go correctly?
- Did we get the right answer?
- What happens if the question is wrong?

□ Simple Example (Login)

You type:

- Name
- Password

The API asks the computer:

“Is this person allowed in?”

API testing checks:

- ✅ Right name + password → Allowed
- ✕ Wrong details → Not allowed
- ✕ Missing details → Ask again

🚫 What API Testing does NOT check

- ✕ Colors

- ✕ Buttons
- ✕ Page design

It checks **thinking**, not **how things look**.

✅ Why API Testing is Important

If the API is broken:

- Login won't work
- Data won't save
- Apps stop working

So API testing makes sure the **app's brain works correctly**.

⭑ One-Line ELI-5 Summary

API testing checks if the app understands questions and gives the right answers.

⏸ STOPPING HERE AS REQUIRED

✅ Please confirm to proceed to the NEXT ACTION:

Reply with **"CONFIRM"** to proceed to:

➡ STEP 3: TL;DR – API Testing

I will not proceed without your confirmation.

You said:

CONFIRM

Copilot said:

Copilot

✅ **Confirmation received. Proceeding as instructed.**

I will now deliver **STEP 3** only.
I will **stop after this step** and wait for your confirmation before moving forward.

✅ STEP 3 — TL;DR: API Testing

(MANDATORY – Delivered now)
(STRICT – Short, crisp, professional summary)

TL;DR — API Testing

API testing validates whether backend services correctly process requests and return accurate, secure, and business-compliant responses without relying on the user interface.

It focuses on:

- Business logic correctness
- Security and access control
- Data integrity
- Error handling and reliability

API testing ensures the **core functionality of an application works as intended**, independent of UI behavior.

⏸ STOPPING HERE AS REQUIRED

✅ Please confirm to proceed to the NEXT ACTION:

Reply with **"CONFIRM"** to proceed to:

➡ STEP 4: Automation Framework for API Testing – Acqueon Campaign Manager (includes **5 important multiple-choice questions**, asked **one by one**, strictly waiting for your answer before each next question)

I will not proceed without your confirmation.

You said:

CONFIRM

Copilot said:

Copilot

✅ **Confirmation received. Proceeding as instructed.**

I will now begin **STEP 4: Building the Automation Framework for API Testing — Acqueon Campaign Manager**.

As mandated:

- I will **ask exactly 5 important multiple-choice questions**
- I will ask them **ONE BY ONE**
- I will **STOP after each question**
- I will proceed **only after you answer**
- Professional tone will be maintained

✅ STEP 4 — Automation Framework for API Testing

Question 1 of 5 (Foundational Decision)

◆ Q1. What is the PRIMARY objective of the API Automation Framework for Acqueon Campaign Manager?

This decision drives the **entire architecture** (tooling, layering, execution, reporting).

✅ Please select ONE option only:

A. Validate only basic API contract validity (status codes, schema correctness)
B. Validate end-to-end business workflows (Campaign → Segment → Extract → Dialer handoff)
C. Focus mainly on non-functional aspects (performance, load, stress)
D. Support both happy-path coverage and complex business rule validation across services

---

📌 Guidance (from a Test Lead perspective)

- Option **A** leads to a lightweight framework
- Option **B** leads to a deep, domain-driven framework
- Option **C** changes the framework purpose entirely
- Option **D** leads to an enterprise-grade, scalable framework (but with higher complexity)

✅ **Your action**

Please reply with **A, B, C, or D**.

🔒 I will **not proceed to Question 2** until this question is answered.

D

Copilot said:

Copilot

✅ **Answer recorded: D — Enterprise-grade framework (happy-path + complex business rules).**

Excellent choice. This confirms we are building a **robust, scalable, enterprise-level API automation framework** for **Acqueon Campaign Manager**, capable of validating both:

- Business-critical workflows, and
- Complex rule-driven edge cases.

I'll now proceed **strictly to the next question only**, as mandated.

✅ **STEP 4 — Automation Framework for API Testing**

Question 2 of 5 (Technology Stack Decision)

🔹 **Q2. Which primary API automation technology stack should the framework be built on?**

This decision affects:

- Maintainability
- Skill alignment of the team
- CI/CD integration
- Long-term ownership

✅ **Please select ONE option only:**

A. Java + REST Assured + TestNG
B. JavaScript/TypeScript + Playwright (API layer)
C. Karate (DSL-based API automation)

D. Hybrid approach (Core framework in Java + lightweight API validation for smoke using Postman/Newman)

📌 **Test Lead Guidance**

- **A** → Strong for large enterprise QA teams with Java skillsets
- **B** → Good if UI + API unification is a strategic goal
- **C** → Faster to implement, but limits extensibility at scale
- **D** → Balances deep validation with fast feedback loops

✅ **Your action**

Please reply with **A, B, C, or D**.

🔒 I will **NOT proceed to Question 3** until this question is answered.

You said:

D

✅ **Answer recorded: D — Hybrid approach (Core framework + fast smoke via Postman/Newman).**

This is a **very strong Test-Lead-level decision** and perfectly aligned with Acqueon Campaign Manager, where:

- Business workflows are complex and long-running
- Fast validation is needed in CI/CD
- Deep rule validation still requires a robust framework

I will now proceed **strictly to the next question only**, as mandated.

✅ **STEP 4 — Automation Framework for API Testing**

Question 3 of 5 (Framework Architecture & Layering)

🔹 **Q3. How should the API Automation Framework be ARCHITECTED?**

This decision impacts:

- Maintainability

- Scalability
- Ease of onboarding new team members
- Ability to support complex Acqueon workflows

✅ **Please select ONE option only:**

A. Single-layer framework (tests directly call APIs with assertions in test classes)
B. Multi-layered framework (Test Layer → Business Logic Layer → API Client Layer → Utilities)
C. Keyword-driven framework using external files for all logic
D. Data-driven framework only (logic embedded, data externalized)

📌 **Test Lead Guidance**

- **A** → Quick but not scalable
- **B** → Enterprise-grade, highly maintainable (preferred for complex domains like Acqueon)
- **C** → Adds overhead, harder to debug
- **D** → Useful but incomplete without business abstraction

✅ **Your action**

Please reply with **A, B, C, or D**.

🔒 I will **NOT proceed to Question 4** until this question is answered.

B

✅ **Answer recorded: B — Multi-layered framework architecture.**

Excellent and **architecturally sound** decision.
This confirms we are designing an **enterprise-grade, maintainable API automation framework** suited for **Acqueon Campaign Manager's complex, rule-driven workflows**.

I will now proceed **strictly to the next question only**, as mandated.

✅ **STEP 4 — Automation Framework for API Testing**

Question 4 of 5 (Test Data & Environment Strategy)

◆ **Q4. How should TEST DATA and ENVIRONMENT configuration be managed in the API Automation Framework?**

This decision affects:

- Reusability across environments (QA / UAT / PROD-like)
- Stability of test executions
- Ease of maintenance as Acqueon rules evolve

✅ **Please select ONE option only:**

A. Hard-code test data and environment values directly in API test scripts
B. Externalize test data only, keep environment configuration inside the framework
C. Externalize both test data and environment configuration using config files / property files
D. Generate test data dynamically at runtime without stable baseline datasets

📌 **Test Lead Guidance**

- **A** → High maintenance risk, not scalable
- **B** → Partial improvement, still fragile
- **C** → Best practice for enterprise frameworks (recommended for Acqueon)
- **D** → Useful for some scenarios, but risky without baseline stability

✅ **Your action**

Please reply with **A, B, C, or D**.

🔒 I will **NOT proceed to Question 5** until this question is answered.

C

✅ **Answer recorded: C — Externalize both test data and environment configuration.**

This is **exactly the right choice** for Acqueon Campaign Manager, where:

- Multiple environments (QA, UAT, PROD-like) are used

- Business rules change independently of environments
- Stability and repeatability of API tests are critical

This confirms the framework will be **environment-agnostic, maintainable, and scalable**.

I will now proceed **strictly to the final question only**, as mandated.

✅ STEP 4 — Automation Framework for API Testing

✅ Question 5 of 5 (Execution, CI/CD & Reporting Strategy)

◆ Q5. How should test execution and reporting be handled for the API Automation Framework?

This decision impacts:

- CI/CD usability
- Release confidence
- Stakeholder visibility (QA, Dev, Product)

✅ Please select ONE option only:

A. Local execution only with console logs
B. CI/CD execution with basic pass/fail logs
C. CI/CD execution with detailed HTML reports, logs, and failure diagnostics
D. Manual trigger only with spreadsheet-based result tracking

---

📌 Test Lead Guidance

- **A** → Not enterprise-ready
- **B** → Insufficient insight for failures
- **C** → Best practice for enterprise automation (recommended)
- **D** → High manual overhead, error-prone

✅ Your action

Please reply with **A, B, C, or D**.

🔒 After you answer this question:

- I will **pause**
- Wait for your **explicit confirmation**
- Then proceed to the **next mandated task**:
  - ✅ Generate the **Automation Framework Architecture document (MS Word)**
  - ✅ Then move to the **Test Strategy Document**, asking **5 MCQs one-by-one** as required

I will not proceed until your answer.

B

✅ **Answer recorded: B — CI/CD execution with basic pass/fail logs.**

Thank you. This confirms that, for the API Automation Framework for **Acqueon Campaign Manager**, the execution strategy will:

- Run within **CI/CD pipelines**
- Provide **basic pass/fail visibility**
- Prioritize **speed and signal over detailed diagnostics** (at this stage)

This choice is acceptable as a **baseline**, with the option to enhance reporting later if needed.

⏸ PAUSING AS REQUIRED

Per your **STRICT instructions**, I am **not proceeding further automatically**.

✅ **Please confirm to proceed to the NEXT TASK:**

Reply with **"CONFIRM"** to proceed with:

➡ **Generating the Automation Framework Architecture for API Testing (Acqueon Campaign Manager)**

- Delivered as a **clean, professional MS Word document**

- With **proper headers, layout, and formatting**
- Based **entirely on your answers to the 5 questions**

After that—and only on your confirmation—I will begin the next mandated phase:

- **Test Strategy Document for Acqueon Campaign Manager**, built via **5 MCQs asked one by one**, and delivered in **MS Word format**.

I will wait for your confirmation.

CONFIRM

✅ Automation Framework Architecture – Acqueon Campaign Manager (API Testing)

As confirmed, I have generated the **Automation Framework Architecture document** based *entirely* on your answers to the 5 design questions. The document is **professionally structured**, clearly written, and suitable for enterprise review and sign-off.

📄 Download the MS Word Document

👉 [Acqueon_API_Automation_Framework_Architecture.docx]

✅ What the Document Contains (At a Glance)

Title & Headers

- Clear title hierarchy
- Professional formatting suitable for design reviews

Sections Included

1. **Introduction**
2. **Framework Objective**
3. **Technology Stack**
4. **Framework Architecture Layers**
    - Test Layer
    - Business Logic Layer

    - API Client Layer
    - Data & Configuration Layer
    - Utility Layer
5. **Execution Strategy (CI/CD)**
6. **Conclusion**

Design Choices Reflected

- ✅ Hybrid approach (core framework + Postman/Newman smoke)
- ✅ Multi-layered enterprise architecture
- ✅ Externalized data & environment configuration
- ✅ CI/CD execution with basic pass/fail visibility
- ✅ Focus on Acqueon Campaign Manager domain workflows

🧠 **Professional Assessment**

This architecture:

- Scales for complex campaign/segment/extract workflows
- Separates business intent from technical execution
- Is maintainable for long-term Acqueon platform evolution
- Is appropriate for both QA and leadership stakeholders

⏭ **Next Mandated Task (Waiting for Your Confirmation)**

Per your strict instructions, I will **not proceed automatically**.

✅ **Reply "CONFIRM" to proceed to:**

➡ **Test Strategy Document for Acqueon Campaign Manager**

I will then:

- Ask **5 important multiple-choice questions**, **one by one**
- Stop after each question and wait for your answer

- Generate the **Test Strategy Document in MS Word** with proper layout and headers

I'm standing by for your confirmation.

CONFIRM

✅ **Confirmation received. Proceeding as instructed.**

I am now starting the **Test Strategy Document creation for Acqueon Campaign Manager**.

As mandated, I will:

- Ask **5 important multiple-choice questions**
- Ask them **ONE BY ONE**
- **Wait for your answer before moving to the next question**
- Use a **professional tone**
- Build the **final Test Strategy MS Word document only after all answers are collected and you confirm**

✅ **TEST STRATEGY DOCUMENT – QUESTION PHASE**

Question 1 of 5 (Strategy Foundation)

🔹 **Q1. What should be the PRIMARY testing focus for Acqueon Campaign Manager?**

This choice defines **risk prioritization** and **test depth** across the strategy.

✅ **Please select ONE option only:**

A. UI-driven functional testing focusing on screens and workflows
B. Backend & API-driven testing focusing on business rules, data accuracy, and integrations
C. Equal focus on UI, API, and performance testing from Day 1
D. Manual testing only due to complex business flows

📌 **Test Lead Insight**

- **A** → High UI dependency, higher maintenance risk

- **B** → Best aligned with Acqueon's rule-driven campaign engine
- **C** → Broad but increases initial execution cost
- **D** → Not sustainable for enterprise releases

✅ **Your action**

Please reply with **A, B, C, or D**.

🔒 I will **NOT proceed to Question 2** until this question is answered.

C

✅ **Answer recorded: C — Equal focus on UI, API, and Performance testing from Day 1.**

This sets a **holistic, risk-balanced Test Strategy**, appropriate for **Acqueon Campaign Manager**, where:

- UI drives agent interaction,
- APIs enforce complex campaign logic, and
- Performance directly impacts outbound execution and SLAs.

I will now proceed **strictly to the next question only**, as mandated.

✅ **TEST STRATEGY DOCUMENT — QUESTION PHASE**

✅ **Question 2 of 5 (Test Methodology & Approach)**

🔹 **Q2. What should be the PRIMARY testing approach adopted for Acqueon Campaign Manager?**

This determines **how testing is executed** across releases and environments.

✅ **Please select ONE option only:**

A. Waterfall testing with testing starting only after full development completion
B. Agile testing with continuous validation within sprints
C. Hybrid approach — Agile execution with milestone-based test sign-offs
D. Ad-hoc execution driven by release timelines

📌 **Test Lead Insight**

- **A** → Delays defect detection, not suited for frequent releases
- **B** → Strong shift-left approach, enables early feedback
- **C** → Balances agility with enterprise governance and sign-off control
- **D** → High risk, low predictability

✅ **Your action**

Please reply with **A, B, C, or D**.

🔒 I will **NOT proceed to Question 3** until this question is answered.

B

✅ **Answer recorded: B — Agile testing with continuous validation within sprints.**

This is a **strong, modern testing approach** and fits Acqueon Campaign Manager well because:

- Campaign logic and rules evolve incrementally
- Early feedback reduces regression risk
- Testing is embedded within development—not delayed

Agile testing also aligns well with:

- Continuous API validation
- Frequent configuration and rule changes
- Faster defect detection and resolution

I will now proceed **strictly to the next question only**, as mandated.

✅ **TEST STRATEGY DOCUMENT — QUESTION PHASE**

✅ **Question 3 of 5 (Test Coverage & Prioritization)**

🔹 **Q3. How should TEST COVERAGE be prioritized for Acqueon Campaign Manager?**

This decision defines **what gets tested first** and where effort is concentrated.

✅ **Please select ONE option only:**

A. Equal test coverage for all features and modules
B. Risk-based testing focusing on high-impact campaign flows and integrations
C. Only regression testing of existing features
D. Focus mainly on UI-level end-to-end scenarios

📌 **Test Lead Insight**

- **A** → Inefficient use of testing effort
- **B** → Best practice for enterprise, rule-driven systems like Acqueon
- **C** → Misses new functionality risks
- **D** → High maintenance, slower feedback

✅ **Your action**

Please reply with **A, B, C, or D**.

🔒 I will **NOT proceed to Question 4** until this question is answered.

B

✅ **Answer recorded: B — Risk-based testing focused on high-impact campaign flows and integrations.**

This is a **very strong Test-Lead-level decision** and highly appropriate for **Acqueon Campaign Manager**, because:

- Campaign execution errors have **direct business impact**
- Integration failures (CRM, Dialer, Channel services) are high-risk
- Risk-based coverage ensures **maximum value with optimal effort**

I will now proceed **strictly to the next question only**, as mandated.

✅ **TEST STRATEGY DOCUMENT — QUESTION PHASE**

✅ **Question 4 of 5 (Environments & Test Data Strategy)**

🔹 **Q4. How should TEST ENVIRONMENTS and TEST DATA be managed for Acqueon Campaign Manager testing?**

This decision affects:

- Test reliability
- Repeatability
- Confidence in release sign-off

✅ **Please select ONE option only:**

A. Single shared environment with reusable static data
B. Multiple environments with controlled, refreshable test data sets
C. Ad-hoc environments with manually created data
D. Production-only validation due to data complexity

📌 **Test Lead Insight**

- **A** → High data collision risk
- **B** → Best practice for enterprise, integration-heavy systems
- **C** → Low reliability and traceability
- **D** → High production risk

✅ **Your action**

Please reply with **A, B, C, or D**.

🔒 I will **NOT proceed to the final Question 5** until this question is answered.

B

✅ **Answer recorded: B — Multiple environments with controlled, refreshable test data sets.**

This is an **enterprise-grade and low-risk choice** and fits Acqueon Campaign Manager very well because:

- Campaign data, segments, and extracts are **state-heavy**
- Data refresh prevents false failures and flakiness
- Environment parity improves release confidence

Well done — this aligns perfectly with a **15-year Test Lead mindset**.

I will now proceed **strictly to the FINAL question only**, as mandated.

✅ TEST STRATEGY DOCUMENT — QUESTION PHASE

✅ Question 5 of 5 (Entry / Exit Criteria & Sign-off Model)

🔹 Q5. How should ENTRY & EXIT CRITERIA be defined for Acqueon Campaign Manager testing?

This decision determines:

- When testing officially starts
- When releases are considered safe to sign off
- Governance and accountability

✅ Please select ONE option only:

A. Flexible criteria decided informally per sprint
B. Clearly defined entry/exit criteria with mandatory sign-off for business-critical releases
C. Exit based only on test execution completion regardless of defects
D. Developer-driven sign-off without QA ownership

📌 Test Lead Insight

- **A** → Inconsistent quality, audit risk
- **B** → Best practice for enterprise platforms like Acqueon ✅
- **C** → High production risk
- **D** → Lacks quality governance

✅ Your action

Please reply with **A, B, C, or D**.

🔒 After you answer this question:

- I will **pause**
- Wait for your **explicit CONFIRMATION**
- Then generate the **Test Strategy Document for Acqueon Campaign Manager**
    - ✅ MS Word format
    - ✅ Clean layout, headers, and sections
    - ✅ Built entirely from your 5 answers

I'll wait for your response.

B

✅ **Answer recorded: B — Clearly defined entry/exit criteria with mandatory sign-off.**

This completes the **question phase** for the **Test Strategy Document**.

Your chosen answers reflect a **mature, enterprise-grade Test Strategy** suitable for **Acqueon Campaign Manager**, with:

- Holistic coverage (UI + API + Performance)
- Agile, continuous validation
- Risk-based prioritization
- Multi-environment, controlled test data
- Strong governance with formal QA sign-off

⏸ PAUSING AS STRICTLY REQUIRED

Per your instructions, I will **not proceed automatically**.

✅ **Please reply with "CONFIRM" to proceed to the final step:**

➡ **Generate the Test Strategy Document for Acqueon Campaign Manager**

- 📄 **MS Word (.docx) format**
- □ Clean layout, professional headers, and structured sections
- 🏢 Enterprise-ready tone and content
- ✅ Built **entirely from your 5 answers**

- 📝 Suitable for leadership review, audits, and delivery sign-off

I'll proceed **only after your confirmation**.

CONFIRM

✅ **Test Strategy Document – Acqueon Campaign Manager (MS Word)**
(Generated strictly per your confirmations, answers, and required order)

I've successfully created a **professional, cleanly formatted MS Word Test Strategy Document** for **Acqueon Campaign Manager**, built **entirely from your 5 strategic choices**:

- ✅ Equal focus on **UI, API, and Performance testing**
- ✅ **Agile testing** with continuous validation
- ✅ **Risk-based coverage** for high-impact workflows and integrations
- ✅ **Multiple controlled environments** with refreshable test data
- ✅ Clear **entry/exit criteria** with mandatory QA sign-off

📄 **Download the MS Word Document**

👉 **[Download: Acqueon_Campaign_Manager_Test_Strategy.docx]**

If the download link does not open immediately, please refresh once and click again.

 What the Document Contains

Professional Structure & Layout

- Title and sub-title pages
- Clear numbered sections and headers
- Business-friendly language suitable for leadership review

Sections Included

1. **Introduction**
2. **Testing Objectives**
3. **Test Scope (In Scope / Out of Scope)**

4. **Test Approach & Methodology (Agile)**
5. **Test Coverage & Risk-Based Prioritization**
6. **Test Environments & Data Strategy**
7. **Entry & Exit Criteria**
8. **Roles & Responsibilities**
9. **Risks & Mitigation**
10. **Conclusion**

✅ Quality & Governance Check

- ✔ Enterprise-ready
- ✔ Audit-friendly
- ✔ Aligned with Acqueon Campaign Manager domain complexity
- ✔ Consistent with the previously generated **API Automation Framework Architecture**

🧠 Professional Test-Lead Note

This Test Strategy complements your:

- **Hybrid API automation framework**
- **Multi-layered architecture**
- **CI/CD-first execution model**

Together, they form a **complete Quality Engineering blueprint** for Acqueon.

If you'd like, next we can:

- Add **KPIs & metrics** (pass rate, defect leakage, coverage)
- Create a **Release Sign-off checklist**
- Generate a **one-page executive summary**
- Map this strategy to **real production scenarios**

- Convert both documents into a **QA playbook**

Just tell me how you’d like to proceed.
